Innate Immunity

Foundations of Public Health
Immunology

Innate Immunity, Inflammation & Nutrition

Objectives
- Identify principles of innate immunity
- Identify receptors and responses of innate cells to microbes (alert system)
- Describe & identify examples of the 4 types of innate defensive barriers
- Identify the cardinal signs of inflammation
- Identify the differences between acute and chronic inflammation
- Identify components of inflammation & how they enhance immunity
- Understand role of nutrition in immune response & identify examples of nutrient deficiencies

Earliest Immune System

- Innate immunity refers to the basic resistance to disease that a species may possess
- Phylogenetically ancient defense
  - Invertebrates & vertebrates both have components of innate immunity (complement, receptors)
  - Only vertebrates contain adaptive responses

Principles of Innate Immunity

- Also known as Natural or Native immunity
- Provides general resistance to antigens
- Not specific for any given pathogen or antigen
  - Provides a rapid response to antigens
- No memory
  - Response does not improve with successive exposures to the same pathogen or antigen

Time is of the essence...

The Battle Begins

- A microbe enters the body...
- How does the innate system detect it?
- How does the innate system tell the rest of the body that there is a problem?
Innate Immunity

All About the Receptors: Recognition

- Innate response is not completely non-specific after all.
- It recognizes PAMPs (Pathogen Associated Molecular Patterns).
- Toll-like receptors & Mannose receptors are part of our cellular membranes that recognize these PAMPs (e.g., LPS, mannose sugars on microbes).
- Receptors then send signals to the cell that a pathogen has entered & to turn up the immune response (alert- there is a problem!)

Watch this animation that shows how TLRs respond to a virus to protect the body.

Read this brief NY Times article on the therapeutic history of Toll-like receptors and how drug companies are now using Toll-like receptors as designer drugs.

Bodily Harm Warning: Microbe Alert!

- Watch this short flash animation that shows the activation of the immune cell as it responds to a bacterial to a Toll-like receptor.

Innate Defenders: Overview

- Four types of defensive barriers:
  - Anatomic (skin, mucous membranes)
  - Physiologic (temperature, pH, oxygen tension)
  - Phagocytic (macrophages, neutrophils ingest molecules)
  - Inflammatory (vasodilatation, capillary permeability)

Defensive Barriers: Anatomic

- Skin: major organ barrier (physical) against external organisms
  - Normal flora prevents colonization, constant sloughing of dead skin
  - Low pH and lysozyme are anti-microbial
- Mucous membranes: protects respiratory, genitourinary (GI), & urogenital tracts
  - Ciliated epithelial cells, mucous, tears, & saliva transport or kill microbes before they can colonize the body

Defensive Barriers: Physiologic

- Fever: pathogens grow at specific temps, and fever raises the body temperature above the preferred range
- pH: low pH in stomach, skin, vagina prevent infection
- Oxygen tension: skin wounds can lead to a decrease in localized tissue perfusion & hypoxia
  - Early innate immune system responds to hypoxia by activating nitric oxide synthase & inflammatory cytokines in wound
Defensive Barriers: Phagocytic

- Literal translation of phagocytosis is eating cell
- Specialized phagocytic cells: Macrophages & Neutrophils
- Cell membrane folds in (endocytosis) & internalizes microbe to form a phagosome
- Fusion with lysosome + enzymes
- Intracellular killing with lysosomal enzymes, reactive oxygen intermediates (ROIs)

Go to the Cells Alive website to read about the oxidative burst!

ROI reaction shown here.

Innate + Adaptive

- Phagocytic cells are linked to adaptive responses
- Produce cytokines, costimulators that target T cells (enhanced antigen presentation)

Defensive Barriers: Inflammatory

- Macrophages release cytokines & ROIs that stimulate inflammation
- Neutrophils also stimulate macs & release ROIs to increase inflammation
- Inflammation enhances the immune response
  - Vasodilation & capillary permeability allow leukocyte migration to sites of tissue injury

Inflammation (-itis)

- The body’s reaction to invasion by an infectious agent, antigenic challenge or physical damage
- NONSPECIFIC response
- Major goal is to allow products of immune system into area of infection or damage

Inflammation

- Acute Inflammation
  - Temporary response to transient injury
  - May develop into chronic inflammation
  - Exudative response

- Chronic inflammation
  - Sustained reaction to persistent injurious stimulus
  - Proliferative response (involving cell-mediated immunity)
  - Granuloma formation may occur
Innate Immunity

Cardinal Signs of Acute Inflammation

- 1. Rubor: redness
- 2. Calor: heat
- 3. Dolor: pain
- 4. Tumor: swelling
- 5. Functio laesa: loss of function

Click through these slide shows on Acute Inflammation & Cardinal Signs to see images of the cardinal signs of inflammation.

ANTI-INFLAMMATORY LIPID MEDIATORS AND INSIGHTS INTO THE RESOLUTION OF INFLAMMATION

Inflammatory Components

- 1. Blood supply changes
  - Increases to bring cells and large molecules to area
- 2. Capillary permeability changes
  - Increases to allow exudation of serum protein
- 3. Leukocyte migration
  - Increase into affected area across venules

Blood Supply Increase (1)

Capillary Permeability Changes (2)
Innate Immunity

Leukocyte Migration (3)
Watch an animation of how immune cells move to the site of injury, as they roll & "stick" to the endothelial cells lining the vessels, before squeezing out into the tissues.

Cell Migration
- Leukocyte migration across endothelium depends upon:
  - surface charge of the interacting cells (occurs where lowest)
  - hemodynamic shear force in vascular bed (occurs where lowest)
  - expression of adhesion molecules on leukocytes and endothelium
- Pattern and purpose of migration depends upon the cell type, state of differentiation and activation
- Ensures that APCs, lymphocytes and antigen converge upon secondary lymphoid tissue, lymph nodes, or spleen to produce an immune response, or upon sites of inflammation

Cells travel to infxn site to destroy (4)

Microbial Evasion Strategies
- Some bacteria have developed ways to defeat innate immunity
- Resist phagocytosis, ROIs to avoid death

Role of Nutrition in Immunity
- Nutrition is a key element to a healthy immune system
- Vitamin deficiencies have been shown to decrease immune function
- And, lead to increased infections

Extremely Brief Review of HUMAN NUTRITION
- FOOD is a mixture of chemicals
- NUTRIENTS are the essential chemicals in foods
- 6 classes of nutrients found in food:
  1.) Carbohydrates
  2.) Lipids
  3.) Proteins
  4.) Vitamins
  5.) Minerals
  6.) Water
Innate Immunity

Macronutrients vs. Micronutrients

**Macro**
- Nutrients such as **carbohydrates, fat, or proteins**, that are needed in relatively large amounts in the diets

**Micro**
- Nutrients such as a **vitamin or mineral** that is needed in relatively small amounts in the diet
- Enables body to produce enzymes, hormones & other substances essential for proper growth and development
- Vitamins A, C, D important to properly functioning immune system
- Zinc & Iron

Fruits & Veggies are important sources of nutrients, especially micronutrients. Photo by Peggy Greb, USDA Image Number K8666-1.

Malnutrition: The Silent Crisis

**Definition:** Failure to achieve nutrient requirements which can impair physical and/or mental health
- May result from consuming too little food or a shortage/imbalance of key nutrients
- Several types:
  - Protein-energy malnutrition (PEM)
    - Kwashiorkor
    - Marasmus
  - Micronutrient deficiencies (Vitamins A, C, D)
  - Mineral deficiencies (Zinc, Iron)

Protein-Energy Malnutrition (PEM)

- **Most widespread** form of malnutrition
- Prevalent in Africa, Central & South America, East
- Condition of infants and children
  - Develops after children are weaned from the breast
  - Micronutrient deficiencies linked to development of PEM
- Widespread **atrophy of lymphoid tissues** & 50% reduction in circulating CD4+ T cells

Marasmus

- A type of malnutrition resulting from chronic protein-energy undernutrition characterized by wasting of muscle and other body tissue
- Physical term for **starvation**
- Often occurs after child weaned from breast milk

Kwashiorkor

- Type of malnutrition that occurs primarily in **young children who have an infectious disease**
- Diets supply marginal amounts of energy and very little protein (carbs)
- Common symptoms include poor growth, edema, apathy, weakness, & susceptibility to infections
- Diarrhea & anemia compound problem

Vitamin A

- Vitamin A needed for
  - Vision (night, day, colour)
  - Epithelial cell integrity (against infections) in skin, mucous membranes
  - Immune response
  - Haemopoiesis
  - Skeletal growth
  - Fertility (male and female)
  - Embryogenesis

Keratomalacia, damage shows an altered/ hyperplastic epithelium and may thus become secondarily infected.
Innate Immunity

Vitamin A Deficiency
- More than one million children a year die as a consequence of a number of diseases precipitated by VAD
- All developing countries affected by multiple micronutrient deficiencies, but vitamin A highly impacts Africa and SE Asia
- VAD prevalent among poor who depend mainly on rice as daily energy source (400 million)
- Rice does not contain β-carotene (provitamin A)
- Most severely affects children and pregnant women
- Compromises immune systems of ~40% of children <5
- Predisposes infants and children to diarrheal disease
- Usually co-existing with PEM
- 250,000 to 500,000 children to go blind every year
- More than half also die within a year

Vitamin C
- Vitamin C helps maintain the redox integrity of cells
- Protects against reactive oxygen species generated during respiratory burst and in the inflammatory response
- Shown to reduce the duration and severity of colds (Mom is right- drink your Orange Juice!)
- Vitamin C supplementation improves immune function:
  - Antimicrobial and natural killer cell activities
  - Lymphocyte proliferation
  - Chemotaxis
  - Delayed-type hypersensitivity
- Vitamin C modulates host resistance to infectious agents, by reducing risk, severity and duration of infectious diseases

Vitamin D
- Humans make Vitamin D in skin-need sunlight
- Also produced by activated macrophages
- Vitamin D is an important immune regulator
- Deficiency results in overactive response & has been linked to some autoimmune diseases

Zinc & Iron
- Zinc important to biological activity of thymus hormones
  - Deficiency results in decreased cell-mediated immunity
  - Impairs phagocytosis, NK cell activity, and generation of oxidative burst
- Iron extremely important to cellular functions & oxygen transport
  - Deficiency impairs oxidative burst in neutrophils

Malnutrition and Infection
- Two causal pathways
  1.) infection leads to malnutrition
  2.) malnutrition increases susceptibility to infections
- Difficult to resolve, pathways may occur concurrently
- Nutrition improves immunity- eat a balanced diet!
Summary of Innate Immunity

- Understand principles of innate immunity
- Innate receptors & signaling networks
- Four innate defensive barriers
- 4 stages of inflammation after tissue damage
- Role of nutrition in immune response
- Specific examples of vitamin deficiencies & immune function

Self-Test Questions

- Name 2 characteristics of innate immunity (principles).
- How does the innate immune response recognize pathogens?
- What are the 4 types of defensive barriers? Give an example of each type.
- What is the difference between acute & chronic inflammation?
- What are the 5 cardinal signs of inflammation?
- What are the 3 major components of the inflammatory response?
- How does nutrition influence the immune response? Give 2 examples of the impact of vitamin deficiencies on immunity.
