Duration: 00:30:02

Slide 1

Laboratory Safety An Overview

Welcome to our first lecture of the Lab Safety and Security course. This lecture was prepared by Dr. Andrew Cannons the Laboratory Director of the Bureau of Public Health Laboratories – Tampa. Audio is provided by Dr. Roberts by request.

Slide 2

Introduction

This slide presentation is intended to provide an overview of the safety regulations that should be place in a facility. It is not intended to provide guidance since that would come from the specific agency. Rather it is intended to identify some key areas of safety oversight

This slide presentation is intended to provide an overview of the safety regulations that should be place in a facility. It is not intended to provide guidance since that would come from the specific agency. Rather it is intended to identify some key areas of safety oversight and set the stage for the rest of the course.

Slide 3

Objectives

- Analyze basic safety aspects in the following categories:
 - General
 - Biosafety
 - Chemical Hygiene
 - Animal Safety
 - Radiological Safety
- Evaluate lab acquired infections and lab incidents
- Review national safety issues
- Demonstrate a culture of safety

In this presentation we will discuss laboratory safety in a general fashion. We will discuss safety in general, Biosafety, Chemical Hygiene, Animal Safety and Radiological Safety. In addition we will briefly discuss Lab Acquired Infections and Lab Incidents and Review National Safety Issues. Finally we will briefly talk about developing a Culture of Safety. This lecture is designed to set the stage for this course on Safety aspects in the laboratory

Slide 4

OSHA

Occupational Safety and Health Act of 1970

"To assure safe and healthful working conditions for working men and women; by authorizing enforcement of the standards developed under the Act; by assisting and encouraging the States in their efforts to assure safe and healthful working conditions; by providing for research, information, education, and training in the field of occupational safety and health.

Let's first discuss why the laboratory needs to be safe. Basically a laboratory can be an unsafe environment whether we are dealing with biological agents, chemicals, radiologicals or animals and minimizing hazards as much as possible is very important, The OSHA act of 1970 really was the first regulation put into place to address safety in the workplace:

Occupational Safety and Health Act of 1970
"To assure safe and healthful working conditions for working men and women; by authorizing enforcement of the standards developed under the Act; by assisting and encouraging the States in their efforts to assure safe and healthful working conditions; by providing for research, information, education, and training in the field of occupational safety and health
<https://www.osha.gov/Publications/osha2254.pdf>

Slide 5

Workplace Safety

- Under the *Occupational Safety and Health Act of 1970*, employers are responsible for providing a safe and healthful workplace. No person should ever have to be injured, become ill, or die for a paycheck.

So for workplace safety, under the OSHA act employers are responsible for providing a safe and healthful workplace. No person should ever have to be injured, become ill, or die for a paycheck.

Slide 6

When Safety Fails

- Profit before safety
 - Safety viewed as a cost not an investment
- Fear
 - Problems not discussed to avoid reprisal
- Ineffective leadership
 - Prevents recognition of risks and opportunities leading to wrong decisions being made
- Non-compliance
 - Not following rules and procedures

Let's look at some reasons why a laboratory might not be the safest place, even though OSHA expects the workplace to be a safe environment. What are reasons why safety can fail:

Profit before safety - Safety is viewed as a cost not an investment
Fear- Problems not discussed to avoid reprisal
Ineffective leadership- Prevents recognition of risks and opportunities leading to wrong decisions being made
Non-compliance- staff not following rules and procedures

Slide 7

When Safety Fails (continued)

- Miscommunication
 - Critical safety information not relayed to the decision makers
- Competency failures
 - Inadequate training
- Ignoring lessons learned
 - Critical information not shared or enforced
- Erosion of funds
 - Cost saving models, combining safety with other positions

And some more reasons
Miscommunication -Critical safety information not relayed to the decision makers
Competency failures- Inadequate training
Ignoring lessons learned- Critical information not shared or enforced
Erosion of funds- Cost saving models, combining safety with other positions

Slide 8

Strong Safety Culture

- Strong Safety Culture = Incident Reduction
- Safety Culture is the result of:
 - Management and employee assumptions and beliefs
 - Attitudes
 - Policies and procedures
 - Priorities, responsibilities and accountability
 - Production and pressures
 - Actions or lack of actions to correct unsafe behavior
 - Employee training and motivation
 - Employee involvement and "buy in"

So what if you build a strong safety culture in your facility?
A Strong Safety Culture equals Incident Reduction
And a Safety Culture is the result of:
Management and employee assumptions and beliefs
Attitudes
Policies and procedures
Priorities, responsibilities and accountability
Production and pressures
Actions or lack of actions to correct unsafe behavior
Employee training and motivation
Employee involvement and "buy in"

Slide 9

Strong Safety Culture (continued)

- Few at risk behaviors
- Low incident rates
- Low turn over
- Low absenteeism
- High productivity

And A Strong Safety Culture will mean
Few at risk behaviors
Low incident rates
Low turn over
Low absenteeism
High productivity

<p>Slide 10</p> <p>Biological Safety</p> <ul style="list-style-type: none"> • The consistent application of safety measures to minimize or prevent exposure to the person handling the agent, lab and building occupants, the community and the environment. <ul style="list-style-type: none"> • Key Safety Measures: <ul style="list-style-type: none"> • good microbiological work practices • safety and containment equipment • facility design consideration 	<p>What is biological safety?</p> <p>We can define it as the consistent application of safety measures to minimize or prevent exposure to the person handling the agent, lab and building occupants, the community and the environment.</p> <p>The Key Safety Measures: good microbiological work practices, use of safety and containment equipment and facility design consideration</p>
<p>Slide 11</p> <p>Biological Safety (continued)</p> <ul style="list-style-type: none"> • Biohazard n (1967): a biological agent or condition (as an infectious organism or <i>insecure laboratory conditions</i>) that constitutes a hazard to man or his environment; also a hazard posed by such an agent or condition. <ul style="list-style-type: none"> • Webster's 9th New Collegiate Dictionary, Miriam- Webster Inc. Publishers, Springfield, MA USA, 1985 	<p>A Biohazard can be defined as a biological agent or condition (as an infectious organism or insecure laboratory conditions) that constitutes a hazard to man or his environment; also a hazard posed by such an agent or condition.</p> <p>This is the Webster's 9th New Collegiate Dictionary, Miriam- Webster Inc. Publishers, Springfield, MA USA, 1985</p>
<p>Slide 12</p> <p>Biological Safety (continued)</p> <p>Biohazard Settings/Biosafety Applications</p> <ul style="list-style-type: none"> • Clinical, PH labs/Hospital Settings (helping sick people) <ul style="list-style-type: none"> • micro labs, in- and out-patient facilities, infirmaries • infection control, standard precautions, airborne precautions (TB, measles, varicella, flu) • social workers, divinity and law school volunteers, students 	<p>What are the Biohazard Settings/Biosafety Applications</p> <p>First we have the Clinical, public health labs/Hospital Settings (helping sick people) microbiology labs, in- and out-patient facilities, infirmaries</p> <p>infection control, standard precautions, airborne precautions (TB, measles, varicella, flu)</p> <p>social workers, divinity and law school volunteers, students</p>

Slide 13

Biological Safety (continued)

Biohazard Settings/Biosafety Applications

- Research, including:
 - human & animal pathogens, select agents (bioterrorism)
 - toxins of biological origin
 - rDNA research, Human Gene Transfer, plants, animals, large scale
- shipping, transport, import, export, permits
- training (BBP, TB, infection control, shipping, Biosafety, BSL-3, work practices, BSC's)
- field work, work abroad (feral animal, insects, arthropods)

What are the Biohazard Settings/Biosafety Applications
Next we have Research, including:
human & animal pathogens, select agents (bioterrorism)
toxins of biological origin
rDNA research, Human Gene Transfer, plants, animals, large scale
shipping, transport, import, export, permits
training (BBP, TB, infection control, shipping, Biosafety, BSL-3, work practices, BSC's)
field work, work abroad (feral animal, insects, arthropods)

Slide 14

Biological Safety (continued)

Biohazard Settings/Biosafety Applications

- Buildings/IAQ
 - fungi, SBS, cooling towers, HVAC, floods, leaks, allergens
- Emergency Response
 - police, fire, plant maintenance personnel, public health officials
 - biohazard spills, exposures, incident review
- Environmental Issues
 - mosquito control program, anthrax sampling (mailrooms)
 - food sanitation
- Other
 - clean air device monitoring (biosafety cabinets, other hoods)
 - facility design, renovation, construction, and commissioning

What as the Biohazard Settings/Biosafety Applications
We also have to consider Buildings/IAQ
Fungi, SBS, cooling towers, HVAC, floods, leaks, allergens
Emergency Response -police, fire, plant maintenance personnel, public health officials, biohazard spills, exposures, incident review
Environmental Issues - mosquito control program, anthrax sampling (mailrooms), food sanitation
Other, including clean air device monitoring (biosafety cabinets, other hoods), facility design, renovation, construction, and commissioning

Slide 15

Biological Safety (continued)

Biohazard Settings/Biosafety Applications

- Cruise ships, airplanes, trains, buses, other crowded conditions
- Homeless shelters, prisons, schools
- Farms, agricultural settings (zoonotic agents)
- Hunting (gutting/dressing wildlife)
- Bioterrorism (local area response)
- Production of medical products, vaccines, drugs, biologics
- Outbreak investigations, war, refugee camps
- Other???

Finally Biohazard Settings/Biosafety Applications can be found in
Cruise ships, airplanes, trains, buses, other crowded conditions
Homeless shelters, prisons, schools
Farms, agricultural settings (zoonotic agents)
Hunting (gutting/dressing wildlife)
Bioterrorism (local area response)
Production of medical products, vaccines, drugs, biologics
Outbreak investigations, war, refugee camps
Are there any others you can think of?

Slide 16

Biological Safety (continued)

Biosafety: Historical Perspective

- Homer (Odyssey XXII)- burned sulfur for fumigation, 800BC
- Hippocrates- involvement of fomes/fomites in disease process, 4th century BC
- Bible
 - move campsites daily, care of wastes, strict dietary/cleanliness
 - rules/regulations regarding lepers
 - (ISOLATION)
 - burn or boil clothing and equipment
- Aristotle - advised Alexander the Great (boil water, bury excreta)

What about the historical aspects of biological safety? We can go way back and find some examples of biosafety being put into practice: Homer (Odyssey XXII)- burned sulfur for fumigation, 800BC

Hippocrates- involvement of fomes/fomites in disease process, 4th century BC

Bible –describes moving campsites daily, care of wastes, strict dietary/cleanliness, rules/regulations regarding lepers, (ISOLATION) burn or boil clothing and equipment

Aristotle - advised Alexander the Great to boil water and bury excreta

Slide 17

Biological Safety (continued)

Biosafety: Historical Perspective

- Susruta (Hindu physician)- cleaning/fumigation of OR before and after operations, 500 AD
- Great plagues- burn victims clothes, burned bodies on 10 foot poles, unique PPE worn by physicians (perfume in beak), full body coverage, Middle Ages
- Girolamo Fracastoro- referred to "seeds" or "germs" of disease. Identified 3 sources of contagion (contact, fomites, air). 1478-1553
- Venice Magistry of Health- fumigated cargo and mail from ships, 1438

What about the historical aspects of biological safety - some examples of biosafety being put into practice (continued):

Susruta (Hindu physician)- cleaning/fumigation of OR before and after operations, 500 AD

Great plagues- burn victims clothes, burned bodies on 10 foot poles, unique PPE worn by physicians (perfume in beak), full body coverage, Middle Ages

Girolamo Fracastoro- referred to "seeds" or "germs" of disease. Identified 3 sources of contagion (contact, fomites, air). 1478-1553

Venice Magistry of Health- fumigated cargo and mail from ships, 1438

Slide 18

Biological Safety (continued)

Biosafety: Historical Perspective

- Leeuwenhoek- studied effect of chemicals on "little animals" under microscope, 1676
- Cotton Mather- 1st in America to vaccinate against smallpox (with smallpox, Jenner used Cowpox), 1720
- James Lind- hygiene as sea (disinfection, filtration of water, cleaning and ventilation of sick bay, special clothes for physicians), 1757
- Nicholas Appert- Canning method for food preservation, 1810
- John Pringle- sanitary trench disposal of waste in warfare

What about the historical aspects of biological safety - some examples of biosafety being put into practice (continued):

Leeuwenhoek- studied effect of chemicals on "little animals" under microscope, 1676

Cotton Mather- 1st in America to vaccinate against smallpox (with smallpox, Jenner used Cowpox), 1720

James Lind- hygiene as sea (disinfection, filtration of water, cleaning and ventilation of sick bay, special clothes for physicians), 1757

Nicholas Appert- Canning method for food preservation, 1810

John Pringle- sanitary trench disposal of waste in warfare

Slide 19

Biological Safety (continued)

Biosafety: Historical Perspective

- Oliver Wendell Holmes (1843), Ignaz Semmelweis (1847) Identified spread of puerperal fever to patients from medical staff. Introduced hand washing to thwart spread.
- Agostino Bassi (lawyer)- suggested use of germicides, patient isolation, and decontamination of clothes and excreta (1835)
- Louis Pasteur- Flame sterilization of surgical tools, heat sterilization of bandages before use on wounds, risk assessment enters forefront with his quote "Chance favors the prepared mind." (1880's)

What about the historical aspects of biological safety - some examples of biosafety being put into practice (continued):
Oliver Wendell Holmes (1843), Ignaz Semmelweis (1847) Identified spread of puerperal fever to patients from medical staff. Introduced hand washing to thwart spread.
Agostino Bassi (lawyer)- suggested use of germicides, patient isolation, and decontamination of clothes and excreta (1835)
Louis Pasteur- Flame sterilization of surgical tools, heat sterilization of bandages before use on wounds, risk assessment enters forefront with his quote "Chance favors the prepared mind." (1880's)

Slide 20

Biological Safety (continued)

Biosafety: Historical Perspective

- Joseph Lister- antiseptic use on open wounds (phenol), poured directly into wounds, lowered infection rate from 90 - 15%, (1860's - 1880's)
- Robert Koch- sterile technique, pure culture, use of solid media, tested over 70 disinfectants, (1881)
- Dakin- 0.5% hypochlorite used to disinfect wounds in WWI
- WWII-1st war with less deaths from disease than from battle wounds (disinfectants in common use)

What about the historical aspects of biological safety - some examples of biosafety being put into practice (continued):
Joseph Lister- antiseptic use on open wounds (phenol), poured directly into wounds, lowered infection rate from 90 - 15%, (1860's - 1880's)
Robert Koch- sterile technique, pure culture, use of solid media, tested over 70 disinfectants, (1881)
Dakin- 0.5% hypochlorite used to disinfect wounds in WWI
WWII-1st war with less deaths from disease than from battle wounds (disinfectants in common use)

Slide 21

Biological Safety (continued)

Pertinent Biosafety Events

- 1918- Flu pandemic
- 1928- Discovery of antibiotics
- 1930's - present - Biowarfare research continues (Japan's Unit 731, many other examples before and after)
- 1930's- U.S. Malaria Control Division (later CDC&P)
- 1940's- Invention of Electron Microscope
 - Can now see viruses!
- 1950's -present- Viral Hemorrhagic Fever outbreaks
- 1967- Marburg virus outbreak in lab
- 1966-1968- development of Biohazard Symbol
- 1969- Lassa Fever LAI's at Yale
- 1970- OSHA, EPA created (OSHA General Duty Clause)

Over the next few slides, let's also look at some pertinent biosafety events throughout history –these typically can be key to operations in the laboratory
1918- Flu pandemic
1928- Discovery of antibiotics
1930's - present - Biowarfare research continues (Japan's Unit 731, many other examples before and after)
1930's- U.S. Malaria Control Division (later CDC&P)
1940's- Invention of Electron Microscope
Can now see viruses!
1950's -present- Viral Hemorrhagic Fever outbreaks
1967- Marburg virus outbreak in lab
1966-1968- development of Biohazard Symbol
1969- Lassa Fever LAI's at Yale
1970- OSHA, EPA created (OSHA General Duty Clause)

Slide 22

Biological Safety (continued)

Pertinent Biosafety Events

- 1974- Classification of Etiologic Agents on Basis of Hazard (Biosafety Levels 1 - 4)
- 1976- NIH rDNA Guidelines
- 1976- Ebola outbreak
- 1978- Smallpox LAI, England
- 1979- Laboratory Safety Monograph (NIH)
- 1979- Anthrax release from military research lab, Sverdlosk, Russia (>60 deaths)
- 1980-1984 - CDC/NIH Biosafety handbook, WHO text
- 1981- 1st HIV cases reported

Let's continue to look at some pertinent biosafety events throughout history

1974- Classification of Etiologic Agents on Basis of Hazard (Biosafety Levels 1 - 4)

1976- NIH rDNA Guidelines

1976- Ebola outbreak

1978- Smallpox LAI, England

1979- Laboratory Safety Monograph (NIH)

1979- Anthrax release from military research lab, Sverdlosk, Russia (>60 deaths)

1980-1984 - CDC/NIH Biosafety handbook, WHO text

1981- 1st HIV cases reported

Slide 23

Biological Safety (continued)

Pertinent Biosafety Events

- 1986- EPA Medical Waste Requirements
- 1988-1994- needles/syringes found on beaches on east coast, Medical Waste Tracking Act established
- 1988-1992- resurgence of TB cases, MDR-TB observed
- 1988-1991- OSHA Bloodborne Pathogens Standard
- 1990- 1st Human Gene Transfer trial initiated (ADA)
- 1993- Hantavirus outbreak, Southwest USA
- 1994- Publication of Richard Preston's, The Hot Zone
- 1994- Sabia LAI, Yale
- 1995 - Hendra virus, Australia/Avian flu, Hong Kong
- 1996- Mad Cow Disease (BSE)

Let's continue to look at some pertinent biosafety events throughout history

1986- EPA Medical Waste Requirements

1988-1994- needles/syringes found on beaches on east coast, Medical Waste Tracking Act established

1988-1992- resurgence of TB cases, MDR-TB observed

1988-1991- OSHA Bloodborne Pathogens Standard

1990- 1st Human Gene Transfer trial initiated (ADA)

1993- Hantavirus outbreak, Southwest USA

1994- Publication of Richard Preston's, The Hot Zone

1994- Sabia LAI, Yale

1995 - Hendra virus, Australia/Avian flu, Hong Kong

1996- Mad Cow Disease (BSE)

Slide 24

Biological Safety (continued)

Pertinent Biosafety Events

- 1997- Influenza A Virus (H5N1) in poultry, Hong Kong
- 1999- West Nile Virus, 1st time ever in U.S.
- 1999- 1st HGT death, UPenn OTC Protocol
- 1999- Nipah Virus, Malaysia (high mortality rate)
- 2001- Anthrax letters shipped via US Mail
- 2002- HGT Trials suspended after 2nd case of leukemia caused by integration of "defective" retroviral vector in host chromosome
- 2003 - SARS Virus
- 2004 - Bird Flu (H5N1) concerns return
- 2004 - SARS LAI's, Tularemia LAI's (BU)

Let's continue to look at some pertinent biosafety events throughout history

1997- Influenza A Virus (H5N1) in poultry, Hong Kong

1999- West Nile Virus, 1st time ever in U.S.

1999- 1st HGT death, UPenn OTC Protocol

1999- Nipah Virus, Malaysia (high mortality rate)

2001- Anthrax letters shipped via US Mail

2002- HGT Trials suspended after 2nd case of leukemia caused by integration of "defective" retroviral vector in host chromosome

2003 - SARS Virus

2004 - Bird Flu (H5N1) concerns return

2004 - SARS LAI's, Tularemia LAI's (BU)

Slide 25

Biological Safety (continued)

Pertinent Biosafety Events

- 2004 – TB Infections, Washington State (associated w/ Madison Aerosol Chamber).
- 2004 – Occular Vaccinia, Pennsylvania (route of exposure unknown).
- 2005 – Vaccinia infection from needlestick, Connecticut (animal research experiment)
- 2006 – *Brucella* infections – Texas A&M (associated w/ Madison Aerosol Chamber). 3 additional seroconversions to *C. burnetii* identified.
- 2007 – Significant non-compliance w/ Select Agent Regulations identified at Texas A&M (SA Research shut down).
- 2007 – U.S. Federal hearings on oversight of BSL3 and BSL4 laboratories.

Let's continue to look at some pertinent biosafety events throughout history

2004 – TB Infections, Washington State (associated w/ Madison Aerosol Chamber).

2004 – Occular Vaccinia, Pennsylvania (route of exposure unknown).

2005 – Vaccinia infection from needlestick, Connecticut (animal research experiment)

2006 – *Brucella* infections – Texas A&M (associated w/ Madison Aerosol Chamber). 3 additional seroconversions to *C. burnetii* identified.

2007 – Significant non-compliance w/ Select Agent Regulations identified at Texas A&M (SA Research shut down).

2007 – U.S. Federal hearings on oversight of BSL3 and BSL4 laboratories

And there are more recent ones too

Slide 26

Biological Safety (continued)

Laboratory Acquired Infections (LAIs)

- Infections acquired through lab or lab related activities (symptomatic or asymptomatic)
- LAI's came with golden age of Microbiology
- LAI's 1930-2001
 - Total: 5, 346 LAI's
 - 190 deaths
 - underreporting likely
 - many more sub-clinical infections?
 - Percentage of lab staff between 1930-1999 who knew route of LAI was 20%
- Also, secondary LAI –the transfer of an occupationally acquired infection to another person outside of the work environment. A case of taking your work home with you!

And important aspect of biological safety is the consideration of

Laboratory Acquired Infections (LAIs)

These are Infections acquired through lab or lab related activities (symptomatic or asymptomatic)

They came with the golden age of Microbiology

Between 1930-2001, there were a Total of 5, 346 LAI's documented, 190 deaths from LAIs

Likely LAIs were, and still are underreported and likely many more sub-clinical infections occurring

The percentage of lab staff between 1930-1999 who knew route of LAI was 20%

Also important. secondary LAI –the transfer of an occupationally acquired infection to another person outside of the work environment. A case of taking your work home with you!

Slide 27

The Fear of HIV Led to Changes in Biosafety

- Universal precautions to prevent contact with blood and body fluids
- Bloodborne Pathogens Standard- 1992
- Other exposures have continued
 - **Fatal Laboratory-Acquired Infection with an Attenuated *Yersinia pestis* Strain** --- Chicago, Illinois, 2009.
 - **Laboratory-Acquired Vaccinia Virus Infection** --- Virginia, 2008
 - **Laboratory-Acquired Brucellosis** --- Indiana and Minnesota, 2006
 - **Laboratory-Acquired West Nile Virus Infections** --- United States, 2002
 - **Laboratory-Acquired Meningococcal Disease** --- United States, 2000

HIV in the 1980s led to changes in biosafety

Brought about Universal precautions to prevent contact with blood and body fluids
The Bloodborne Pathogens Standard was introduced in 1992

Since then we do know exposures that have continued –so LAIs is not fixed

Fatal Laboratory-Acquired Infection with an Attenuated *Yersinia pestis* Strain --- Chicago, Illinois, 2009.

Laboratory-Acquired Vaccinia Virus Infection --- Virginia, 2008

Laboratory-Acquired Brucellosis --- Indiana and Minnesota, 2006

Laboratory-Acquired West Nile Virus Infections --- United States, 2002

Laboratory-Acquired Meningococcal Disease --- United States, 2000

Slide 28

Where do we need to be for all labs?

This figure demonstrate a road, the biosafety road map, with 7 stops detailing where we need to be for all labs. The steps are as follows:

Stop 1 – Biosafety risk assessment

Stop 2 – Selection of safety practices to prevent portal of entry

Stop 3 – Select and incorporate biosafety competencies

Stop 4 – Safety orientation and training

Stop 5 – Audits, monitoring, safety committee

Stop 6 – Occupational health program

Stop 7 – Creating a culture of safety

Slide 29

Chemical Safety

- Hazard Communication and the Right to Know
 - Enacted in 1984 after the Bhopal Incident.
 - Standard created to ensure safety when working with chemicals.
 - Hazard Communication = Right to Know
 - Since 2012 it is the Right to Understand

You have a **RIGHT TO UNDERSTAND** about the hazardous chemicals you use on the job and how to work safely with them.

Let's move on to Chemical Safety
Chemical safety includes Hazard Communication and the Right to Know
This was Enacted in 1984 after the Bhopal Incident.

The chemical hygiene Standard was created to ensure safety when working with chemicals.
Hazard Communication = Right to Know

Since 2012 it is the Right to Understand

Basically You have a **RIGHT TO UNDERSTAND** about the hazardous chemicals you use on the job and how to work safely with them.

Slide 30

Chemical Safety (continued)

Chemical Hygiene Plan

- A written program developed with

- Procedures
- Controls and Monitoring
- Medical Consultation
- Responsibilities

to protect employees from the health hazards presented by hazardous chemicals and toxins used in the laboratory.

As part of the program a laboratory is required to have a Chemical Hygiene Plan
This is a written program developed with
Procedures
Controls and Monitoring
Medical Consultation
Responsibilities

This is aimed to protect employees from the health hazards presented by hazardous chemicals and toxins used in the laboratory.

Slide 31

Chemical Safety (continued)

- Employers must...

- Identify and create list of potentially hazardous chemicals (and biologicals) you may encounter. (Chemical Inventory)
- Inform you of operations where hazardous chemicals (and biologicals) are present. (SOPs)
- Inform you of ways to protect against hazardous chemicals (and biologicals). (PPE)
- Maintain and explain about Safety Data Sheets (SDSs) on site
- Inform you of availability of written Hazard Communication Plan (Training)

As part of the program Employers must...
Identify and create list of potentially hazardous chemicals (and biologicals) you may encounter. (Chemical Inventory)
Inform staff of operations where hazardous chemicals (and biologicals) are present. (SOPs)
Inform staff of ways to protect against hazardous chemicals (and biologicals). (PPE)
Maintain and explain to staff about Safety Data Sheets (SDSs) on site
Inform staff of the availability of written Hazard Communication Plan (Training)

Slide 32

Chemical Safety (continued)

- Standard Laboratory Practices

- Know and understand what you are working with
- Limit access to work area
- Post hazard warning signs on doors
- Wear appropriate PPE
- No eating or drinking in lab

The Standard Laboratory Practices for chemical hygiene/safety are
Know and understand what you are working with
Limit access to work area
Post hazard warning signs on doors
Wear appropriate PPE
No eating or drinking in lab

Slide 33

Chemical Safety (continued)

- Standard Laboratory Practices
 - Wash hands frequently and after handling hazardous materials
 - Maintain a clean workspace and decontaminate work surfaces daily
 - Properly dispose of all materials
 - Follow SOPs for biologicals, chemicals, sharps, and equipment

The Standard Laboratory Practices for chemical hygiene/safety are
Staff must Wash hands frequently and after handling hazardous materials
Staff must Maintain a clean workspace and decontaminate work surfaces daily
Staff must Properly dispose of all materials
Staff must Follow SOPs for biologicals, chemicals, sharps, and equipment

Slide 34

Chemical Safety (continued)

- Includes Safety Showers and Eyewash Stations
 - Know the location of these stations.
 - Keep path to them unobstructed.
 - It should take you 10 seconds or less to reach them from any place in the lab

Chemical safety includes the equipment used in case of an exposure, that includes the Safety Showers and Eyewash Stations
Staff must Know the location of these stations.
Staff must Keep the path to them unobstructed.
It should take staff 10 seconds or less to reach them from any place in the lab

Slide 35

Chemical Safety (continued)

- What to do in the event of an exposure
- Have a plan that all staff know and understand, for example:
 - Alert coworkers of the exposure
 - **For eye exposure**
 - Run the eyewash for 15 minutes while eyelids are open.
 - Assistance will be needed
 - **For skin exposure**
 - Thoroughly wash with soap and water
 - Under Safety shower for 15 minutes while removing contaminated clothing
 - Notify Supervisor

Staff need to know what to do in the event of an exposure
There must be a plan that all staff know and understand, for example:
Alert coworkers of the exposure
 For eye exposure
 Run the eyewash for 15 minutes while eyelids are open.
 Assistance will be needed
 For skin exposure
 Thoroughly wash with soap and water
 Under Safety shower for 15 minutes while removing contaminated clothing
Notify Supervisor

Slide 36

Chemical Safety (continued)

- First Aid Kit and Spill Kit
 - Should be required for each lab section
 - Should be Labeled and Accessible
 - Items for each kit pre-identified
 - Staff should not be afraid to use
 - Out of date items must be replaced

In addition labs need to consider First Aid Kit and Spill Kit

Should be required for each lab section
Should be Labeled and Accessible
Items for each kit pre-identified
Staff should not be afraid to use
Out of date items must be replaced

Slide 37

Chemical Safety (continued)

- Record Keeping
- Based on Agency's requirements. For example:
 - Inventory of chemicals (on going)
 - Accident/Incident report records (7 years)
 - Inspections of all safety equipment such as eyewash stations, showers, respirators, hoods and hazardous waste containers (3 years)
 - Exposure records are retained for 30 years beyond separation or termination of employment
 - Employee Training are retained for 3 years

Chemical safety also requires Record Keeping and how often these are done and how long these are kept for is Based on Agency's requirements. For example:

Inventory of chemicals (on going)
Accident/Incident report records (7 years)
Inspections of all safety equipment such as eyewash stations, showers, respirators, hoods and hazardous waste containers (3 years)
Exposure records are retained for 30 years beyond separation or termination of employment
Employee Training are retained for 3 years

Slide 38

Chemical Safety (continued)

- "There is a definite correlation between orderliness and level of safety in the laboratory."

"There is a definite correlation between orderliness and level of safety in the laboratory."

Slide 39

Animal Safety

- Animal studies typically have oversight by an Office of Comparative Medicine (OCM)
- Serves as the advocate for animals in research
- Should be accredited, eg by association for assessment and accreditation of laboratory animal care (AAALAC)
- OCM typically use standards such as:
 - Guide for Care and Use of Laboratory Animals
 - Animal welfare Regulations
 - FDA good laboratory practices
 - IACUC principles and procedures of animal care and use

Let's now move on to Animal Safety
Animal studies typically have oversight by an Office of Comparative Medicine (OCM). The OCM serves as the advocate for animals in research.

The OCM should be accredited, eg by association for assessment and accreditation of laboratory animal care (AAALAC)

The OCM typically use standards such as:

Guide for Care and Use of Laboratory Animals

Animal welfare Regulations

FDA good laboratory practices

IACUC principles and procedures of animal care and use

Slide 40

Animal Safety (continued)

- IACUC –Institutional Animal Care and Use Committee
 - support excellence in research and teaching involving vertebrate animals.
 - reviews use of vertebrate animals in research and testing
 - reviews concerns about animal care or use
 - provides guidance regarding use of animals
 - represent the interests of the research and general community regarding use of animals
 - Consider animal rights versus animal welfare

The IACUC –Institutional Animal Care and Use Committee

They support excellence in research and teaching involving vertebrate animals.

They review use of vertebrate animals in research and testing

They review concerns about animal care or use

They provide guidance regarding use of animals

They represent the interests of the research and general community regarding use of animals

They consider animal rights versus animal welfare

Slide 41

Animal Safety (continued)

- IACUC –Institutional Animal Care and Use Committee
 - Animal Welfare Act, 1966
 - Requires that basic standards of care and treatment be provided for animals bred and sold for use as pets, used in biomedical research, transported commercially, or exhibited to the public.
 - Facilities must provide animals with adequate care and treatment in the areas of housing, handling, sanitation, nutrition, water, veterinary care, and protection from extreme weather and temperatures.

The IACUC –Institutional Animal Care and Use Committee

Animals in research are protected by the Animal Welfare Act, 1966

Requires that basic standards of care and treatment be provided for animals bred and sold for use as pets, used in biomedical research, transported commercially, or exhibited to the public.

Facilities must provide animals with adequate care and treatment in the areas of housing, handling, sanitation, nutrition, water, veterinary care, and protection from extreme weather and temperatures.

Slide 42

Animal Safety (continued)

Occupational Health and Safety in the Care and Use of Animals

- Occupational health and safety principles require that personnel caring for and/or using animals know the hazards associated with their work
- Understand how these hazards are controlled, have safe practices, and use protective supplies and equipment.
- Before beginning animal research, personnel must be familiar with the health risks involved, including those associated with the species involved.

Occupational Health and Safety in the Care and Use of Animals -this is there to protect the staff working with the animals
Occupational health and safety principles require that personnel caring for and/or using animals know the hazards associated with their work
Staff should understand how these hazards are controlled, have safe practices, and use protective supplies and equipment.
Before beginning animal research, personnel must be familiar with the health risks involved, including those associated with the species involved.

Slide 43

Animal Safety (continued)

Occupational Health and Safety in the Care and Use of Animals

- Utilize Standard Operating Procedures (SOPs) will be in place to outline procedures, e.g.:
 - Occupational Health and Safety
 - Standard Safety Practice in Animal Rooms
 - Health Hygiene and Laboratory Attire
 - Hazard Communication
 - Allergies to Animals

Occupational Health and Safety in the Care and Use of Animals -this is there to protect the staff working with the animals
Staff are required to Utilize Standard Operating Procedures (SOPs) that are be in place to outline procedures, e.g.:
Occupational Health and Safety
Standard Safety Practice in Animal Rooms
Health Hygiene and Laboratory Attire
Hazard Communication
Allergies to Animals

Slide 44

Radiological Safety

- Radiation is used in medicine, academics, and industry, as well as for generating electricity.
- Radiation has useful applications in such areas as agriculture, archaeology (carbon dating), space exploration, law enforcement, geology (including mining), and many others.
- Hospitals, doctors, and dentists use a variety of nuclear materials and procedures to diagnose, monitor, and treat a wide assortment of metabolic processes and medical conditions in humans.
- Universities, colleges, high schools, and other academic and scientific institutions use nuclear materials in course work, laboratory demonstrations, experimental research, and a variety of health physics applications.
- Naturally occurring radiation can be found all around us.

Let's now move on to Radiological Safety
Radiation is used in medicine, academics, and industry, as well as for generating electricity.
Radiation has useful applications in such areas as agriculture, archaeology (carbon dating), space exploration, law enforcement, geology (including mining), and many others.
Hospitals, doctors, and dentists use a variety of nuclear materials and procedures to diagnose, monitor, and treat a wide assortment of metabolic processes and medical conditions in humans.
Universities, colleges, high schools, and other academic and scientific institutions use nuclear materials in course work, laboratory demonstrations, experimental research, and a variety of health physics applications.
Naturally occurring radiation can be found all around us.

Slide 45

Radiological Safety (continued)

- There are two basic types of radiation:
- Non-ionizing radiation
 - Comes in the form of light, radio waves, microwaves and radar. This kind of radiation usually does not cause tissue damage.
- Ionizing radiation
 - Radiation that produces immediate chemical effects on human tissue
 - X-rays, gamma rays, and particle bombardment (neutron beam, electron beam, protons, mesons, and others) give off ionizing radiation.
 - This type of radiation can be used for medical testing and treatment, industrial and manufacturing purposes, weapons and weapons development, and more.

There are two basic types of radiation:
Non-ionizing radiation – this Comes in the form of light, radio waves, microwaves and radar. This kind of radiation usually does not cause tissue damage.

Ionizing radiation –this is Radiation that produces immediate chemical effects on human tissue. Includes X-rays, gamma rays, and particle bombardment (neutron beam, electron beam, protons, mesons, and others) give off ionizing radiation. This type of radiation can be used for medical testing and treatment, industrial and manufacturing purposes, weapons and weapons development, and more.

Slide 46

Radiological Safety (continued)

- Types of Radiation hazards
 - External Exposure:
 - whole-body
 - partial-body
 - Contamination:
 - External: radioactive material on the skin
 - Internal: radioactive material inhaled, swallowed, absorbed through skin or wounds

The Types of Radiation hazards are

External Exposure:

whole-body

partial-body

And Contamination:

External: radioactive material on the skin

Internal: radioactive material inhaled, swallowed, absorbed through skin or wounds

Slide 47

Radiological Safety (continued)

ALARA

- As Low As Reasonably Achievable
 - “Does the benefit outweigh the risk?”
- What is reasonable?
 - State and cost of technology
 - Cost vs. benefit
 - Societal & socioeconomic considerations

An important consideration with radiation safety is the term ALARA

ALARA stands for As Low As Reasonably Achievable. Basically this means “Does the benefit outweigh the risk?”

And What is reasonable to consider ?

State and cost of technology

Cost vs. benefit

Societal & socioeconomic considerations

Slide 48

Radiological Safety (continued)

- If benefit outweighs the risk:
 - Review the operation for further potential improvements (i.e. reduction in exposure)
 - There are three basic concepts to minimize radiation exposure:
 - Time: minimizing the time of exposure directly reduces radiation dose
 - Distance: doubling the distance between your body and the radiation source will divide the radiation exposure by a factor of 4
 - Shielding: using absorber materials such as Plexiglas for beta particles and lead for X-rays and gamma rays is an effective way to reduce radiation exposures

If the benefit does outweigh the risk, then the staff and employer should

Review the operation for further potential improvements (i.e. reduction in exposure)

Consider that there are three basic concepts to minimize radiation exposure:

Time: minimizing the time of exposure directly reduces radiation dose

Distance: doubling the distance between your body and the radiation source will divide the radiation exposure by a factor of 4

Shielding: using absorber materials such as Plexiglas for beta particles and lead for X-rays and gamma rays is an effective way to reduce radiation exposures

Slide 49

Restoring Confidence for a Culture of Safety

- Not just encourage staff to work toward change, expect them to take action when needed
 - Staff should feel comfortable to tell a Lab Director to put on PPE in their lab
- No room for “safety is not my responsibility”
- Leaders must be visibly committed to change and enable staff to openly share information
- Staff must be willing to report adverse events
 - No fear of reprisal
 - Must believe reporting will affect change

Restoring Confidence for a Culture of Safety
Finally let's consider a culture of safety for ALL hazards

This can include

Not just encourage staff to work toward change, expect them to take action when needed

Staff should feel comfortable to tell a Lab Director to put on PPE in their lab

No room for “safety is not my responsibility”

Leaders must be visibly committed to change and enable staff to openly share information

Staff must be willing to report adverse events

No fear of reprisal

Must believe reporting will affect change

Slide 50

Building the Community of Practice

- Development of training workshops and webinars.
- Creation of online forums to foster a community of practice around biosafety/biosecurity.
- Creation of an online repository of outreach models, training courses, risk assessment templates and other safety/security tools that can be applied to all laboratories.

Safety in the facility is about building a community of practice

That is Development of training workshops and webinars.

The Creation of online forums to foster a community of practice around biosafety/biosecurity.

The Creation of an online repository of outreach models, training courses, risk assessment templates and other safety/security tools that can be applied to all laboratories.

Slide 51

Encouragement of Public Trust

- The need for rigorous scientific research on best practices
 - Evidence based biosafety practices
- Reduce the inclination to adopt overly engineered solutions
 - Not all testing needs to be BSL-3
- Need scientific evidence of the effectiveness of mitigation measures

Safety in the facility is about building public trust

The need for rigorous scientific research on best practices. This includes Evidence based biosafety practices

The need to Reduce the inclination to adopt overly engineered solutions. For example Not all testing needs to be BSL-3

The Need for scientific evidence of the effectiveness of mitigation measures

Slide 52

Future Vision for Safety in Labs

- Labs will have active viable safety programs
- Over time, quality indicators can be measured, for example:
 - Risk assessments completed
 - Risk assessments revised and reasons for revision
 - Reduction in exposures
 - Competencies in place

What is the future for laboratory safety?

Labs will have active viable safety programs

Over time, quality indicators can be measured, for example:

Risk assessments completed

Risk assessments revised and reasons for revision

Reduction in exposures

Competencies in place

Slide 53

Lecture Summary

- In this lecture we have discussed basic safety aspects with respect to general safety, biosafety, chemical hygiene, animal safety, and radiological safety. This lecture provided a very brief overview of these topics and each will be discussed in greater detail in the coming weeks.
- A number of lab acquired infections and lab incidents as well as challenges posed by newer pathogens have shaped laboratory safety as it is approached today.
- Laboratory safety is important not only to provide the worker with a safe employment environment but also to build trust in the community.
- Laboratories must adopt a culture of safety to achieve the above goals.

In this lecture we have discussed basic safety aspects with respect to general safety, biosafety, chemical hygiene, animal safety, and radiological safety. This lecture provided a very brief overview of these topics and each will be discussed in greater detail in the coming weeks.

A number of lab acquired infections and lab incidents as well as challenges posed by newer pathogens have shaped laboratory safety as it is approached today.

Laboratory safety is important not only to provide the worker with a safe employment environment but also to build trust in the community.

Laboratories must adopt a culture of safety to achieve the above goals.
